

Measuring Your Spa

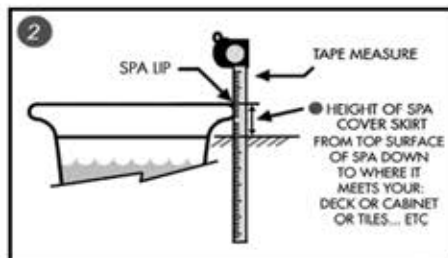

How to obtain Correct Measurements

MEASURING WIDTH AND LENGTH OF SPA (A & B)

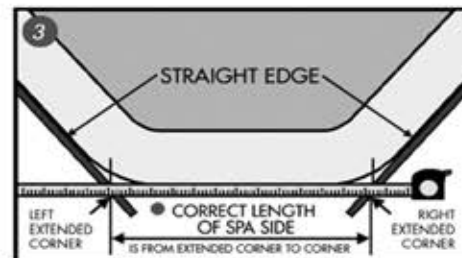

You must Measure the Spa Width from outside to outside edge, using an upright ruler to allow for any flares in the lid.

HEIGHT OF LIP (C)

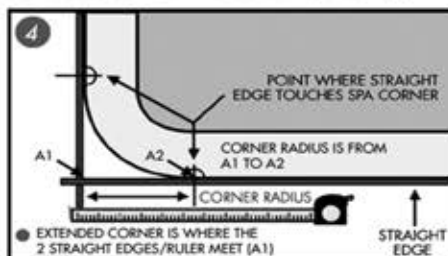

LENGTH OF SIDES (D1, D2, D3, D4)

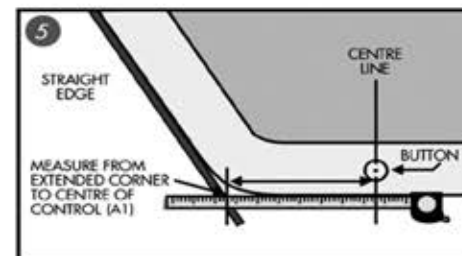

You must measure from extended corner to extended corner

RADIUS OF CORNERS (R)

POSITION OF CONTROLS

Required only if controls sit more than 15mm above spa lip.

MEASUREMENTS THAT ARE REQUIRED:

Length and width (ensure that both these measurements are checked, even if they look the same it is vital that each is measured individually). This also applies to the round spas. (Refer to Diagram 1.)

Height of the lip is also a most important measurement that needs to be accurate. (Refer to Diagram 2.)

Length of Sides A spa with more than 4 sides will need each side accurately measured. (Refer to Diagram 3.)

Radius of the corners this measurement applies to spas that have rounded corners. (Refer to Diagram 4.)

Position of controls need to be measured as well if they exceed 24mm in height, this allows the foam core of the spa cover to be modified to fit over the controls. (Refer to Diagram 5.)

MEASURING TOOLS YOU WILL NEED

1. A measuring tape with metric rule.
2. A minimum of two straight edges that are at least one metre long.
3. Somebody to help you measure as the measurements need to be totally accurate.

DEFINITION OF AN EXTENDED CORNER

When a spa has a curved corner, the extended corner is where the sides would meet had the corner been straight.

There is no better...
